

## Week 7: Strings

III EMSE 4571: Intro to Programming for Analytics
O John Paul Helveston
:: February 24, 2022

## Go to \#c lass channel in Slack for quiz link

## Open RStudio first!

## Rules:

- You may use your notes and RStudio
- You may not use any other resources (e.g. the internet, your classmates, etc.)

## Week 7: Strings

1. Making strings
2. Case conversion \& substrings
3. Padding, splitting, \& merging

BREAK
4. Detecting \& replacing

## Week 7: Strings

1. Making strings
2. Case conversion \& substrings
3. Padding, splitting, \& merging

BREAK
4. Detecting \& replacing

## Install the stringr library

```
install.packages("stringr")
```

(Only do this once...and you already did this in HW 2)

## Load the stringr library

## library(stringr)

(Do this every time you use the package)

## Make a string with

 'single' or "double" quotesUse them where it makes sense

```
cat("This is a string")
```

```
#> This is a string
```

```
cat('This is a string')
```

\#> This is a string

Use single quotes when " is in the string

```
cat('I said, "Hello"')
```

```
#> I said, "Hello"
```

## What if a string has both ' and " symbols?

## Example: It's nice to say, "Hello"

```
cat("It's nice to say, "Hello"")
```

```
#> Error: <text>:1:25: unexpected symbol
#> 1: cat("It's nice to say, "Hello
#>
```

cat('It's nice to say, "Hello"'')
\#> Error: <text>:1:9: unexpected symbol
\#> 1: cat('It's
\#>

## "Escaping" to the rescue!

## Use the \symbol to "escape" a literal symbol

```
cat("It's nice to say, \"Hello\""') #
Double quote
```

```
#> It's nice to say, "Hello"
```

cat('It\'s nice to say, "Hello"') \#
Single quote

```
#> It's nice to say, "Hello"
```

Commonly escaped symbols:

```
cat('This\nthat') # New line: In
```

```
#> This
#> that
```

```
cat('This\tthat') # Tab space: It
```

\#> This
that

```
cat('This\\that') # Backslash: ||
```

## String constants: Sets of common strings

## letters

$$
\begin{aligned}
& \text { \#> [1] "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m" "n" "o" "p" "q" "r" "s" "t" } \\
& \text { "u" "v" "w" "x" "y" "z" }
\end{aligned}
$$

## LETTERS

```
#> [1] "A" "B" "C" "D" "E" "F" "G" "H" "I" "J" "K" "L" "M" "N" "O" "P" "Q" "R" "S" "T"
"U" "V" "W" "X" "Y" "Z"
```

## String constants: Sets of common strings

```
month. name
```

\#> [1] "January" "February" "March" "April" "May"
"August" $" S e p t e m b e r " ~ " O c t o b e r " ~ " N o v e m b e r " ~ " D e c e m b e r " ~$
month.abb
\#> [1] "Jan" "Feb" "Mar" "Apr" "May" "Jun" "Jul" "Aug" "Sep" "Oct" "Nov" "Dec"

## The stringr library has a few longer string constants:

## fruit, words, sentences

length(fruit)
length(sentences)
\#> [1] 80
fruit [1:4]
\#> [1] "apple" "apricot" "avocado" "banana"
length(words)
\#> [1] 980
words [1:4]
\#> [1] "a" "able" "about"
"absolute"
\#> [1] 720
sentences [1:4]
\#> [1] "The birch canoe slid on the smooth planks." "Glue the sheet to the dark blue background." "It's easy to tell the depth of a well." "These days a chicken leg is a rare dish."

## Week 7: Strings

1. Making strings
2. Case conversion \& substrings
3. Padding, splitting, \& merging

BREAK
4. Detecting \& replacing

## Case conversion \& substrings

| Function | Description |
| :--- | :--- |
| str_to_lower() | converts string to lower case |
| str_to_upper() | converts string to upper case |
| str_to_title() | converts string to title case |
| str_length() | number of characters |
| str_sub() | extracts substrings |
| str_locate() | returns indices of substrings |
| str_dup() | duplicates characters |

## Case conversion

```
x <- "Want to hear a joke about paper? Never mind, it's tearable."
```

```
str_to_lower(x)
```

\#> [1] "want to hear a joke about paper? never mind, it's tearable."

```
str_to_upper(x)
```

\#> [1] "WANT TO HEAR A JOKE ABOUT PAPER? NEVER MIND, IT'S TEARABLE."

```
str_to_title(x)
```

\#> [1] "Want To Hear A Joke About Paper? Never Mind, It's Tearable."

## Comparing strings

## Case matters:

```
a <- "Apples"
b <- "apples"
a == b
```

```
#> [1] FALSE
```

Convert case before comparing if you just want to compare the string text:

```
str_to_lower(a) == str_to_lower(b)
```

\#> [1] TRUE
str_to_upper(a) == str_to_upper(b)
\#> [1] TRUE

## Get the number of characters in a string

The length() function returns the vecto length:

To get the \# of characters, use str_length():

```
length("hello world")
```

## \#> [1] 1

```
str_length("hello world")
```

```
#> [1] 11
```

```
str_length(" ") # Spaces count
```

\#> [1] 1
str_length("'") \# Empty string
\#> [1] 0

## Access characters by their index with str_sub( )

Indices start at 1:

```
str_sub("Apple", 1, 3)
```

```
#> [1] "App"
```

Negative numbers count backwards from end:

```
str_sub("Apple", -3, -1)
```

\#> [1] "ple"

Modify a string with str_sub():

```
x <- 'abcdef'
str_sub(x, 1, 3) <- 'ABC'
X
```

## Get the indices of substrings

Extract the substring "Good" from the following string:
x <- 'thisIsGoodPractice'
1): Use str_locate( ) to get the start and end indices:

```
indices <- str_locate(x, 'Good')
indices
```

```
#> start end
#> [1,] 7 10
```

2): Use str_sub() to get the substring:

```
str_sub(x, indices[1], indices[2])
```

```
#> [1] "Good"
```

## Repeat a string with str_dup ( )

```
str_dup("holla", 3)
```

```
#> [1] "hollahollaholla"
```

Note the difference with rep():

```
rep("holla", 3)
```

\#> [1] "holla" "holla" "holla"

## stringr functions work on vectors

```
x <- c("apples", "oranges")
X
```

```
#> [1] "apples" "oranges"
```

Get the first 3 letters in each string:

$$
\operatorname{str} \_\operatorname{sub}(x, 1,3)
$$

\#> [1] "app" "ora"

Duplicate each string twice

```
str_dup(x, 2)
```

## Quick practice:

Create this string object:
x <- 'thisIsGoodPractice'

Then use stringr functions to transform $x$ into the following strings:

- 'thisIsGood'
- 'practice'
- 'GOOD'
- 'thisthisthis'
- 'G00DG00DG00D'

Hint: You'll need these:

- str_to_lower()
- str_to_upper()
- str_locate()
- str_sub()
- str_dup()

## Week 7: Strings

1. Making strings
2. Case conversion \& substrings
3. Padding, splitting, \& merging

BREAK
4. Detecting \& replacing

## Padding, splitting, \& merging

| Function | Description |
| :--- | :--- |
| str_trim( ) | removes leading and trailing whitespace |
| str_pad() | pads a string |
| paste() | string concatenation |
| str_split() | split a string into a vector |

## Remove excess white space with str_trim( )

| $x<-$ " <br> $x$ | aStringWithSpace | " |
| :--- | :---: | :---: |
| \#> [1] " | aStringWithSpace |  |
| str_trim(x) \# Trims both sides by default |  |  |

[^0]```
str_trim(x, side = "left") # Only trim left side
```

```
\#> [1] "aStringWithSpace
```

```
str_trim(x, side = "right") # Only trim right side
```

## Add white space (or other characters) with str_pad ( )

```
x <- "hello"
x
```

```
#> [1] "hello"
```

```
str_pad(x, width = 10) # Inserts pad on left by default
```

```
#> [1] " hello"
```

```
str_pad(x, width = 10, side = "both") # Pad both sides
```

```
#> [1] " hello "
```

str_pad(x, width = 10, side = "both", pad = '*') \# Specify the pad
\#> [1] "**hello***"

## Combine strings into one string with paste( )

```
paste('x', 'y', 'z')
```

```
#> [1] "x y z"
```

Control separation with sep argument (default is " ":

```
paste('x', 'y', 'z', sep = ''-'')
```

\#> [1] "x-y-z"

## Combine strings into one string with paste ( )

Note the difference with vectors of strings:

```
paste(c('x', 'y', 'z'))
```

\#> [1] "x" "y" "z"
To make a single string from a vector of strings, use collapse:

```
paste(c('x', 'y', 'z'), collapse = '"')
```

```
#> [1] "xyz"
```

## Split a string into multiple strings with str_split ( )

```
x <- 'This string has spaces-and-dashes'
x
```

\#> [1] "This string has spaces-and-dashes"

```
str_split(x, " ") # Split on the spaces
```

"string"
"has"
"spaces-and-dashes"

```
str_split(x, "-") # Split on the dashes
```

\#> [[1]]
\#> [1] "This string has spaces" "and" "dashes"

## What's with the [ [1] ] thing?

str_split() returns a list of vectors

```
x <- c('babble', 'scrabblebabble')
str_split(x, 'bb')
```

```
#> [[1]]
#> [1] "ba" "le"
#>
#> [[2]]
#> [1] "scra" "leba" "le"
```

If you're only splitting one string, add [ [1] ] to get the first vector:

```
str_split('hooray', 'oo')[[1]]
```

## Common splits (memorize these!)

Splitting on "'" breaks a string into characters:

```
str_split("apples", "")[[1]]
```

\#> [1] "a" "p" "p" "l" "e" "s"

Splitting on " " breaks a sentence into words:

```
x <- "If you want to view paradise, simply look around and view it"
str_split(x, " ")[[1]]
```

\#> [1] "If" "you"
"look"

"around"

## Quick practice:

Create the following objects:

```
x <- 'this_is_good_practice'
y <- c('hello', 'world')
```

Use stringr functions to transform $x$ and $y$ into the following:

- "hello world"
- "***hello world***"
- c("this", "is", "good", "practice")
- "this is good practice"
- "hello world, this is good practice"

Hint: You'll need these:

- str_trim()
- str_pad()
- paste()
- str_split()

## Your turn

1) reverseString (s): Write a function that returns the string s in reverse order.

- reverseString("aWordWithCaps") == "spaChtiWdroWa"
- reverseString("abcde") == "edcba"
- reverseString("") == ""

2) isPalindrome( $s$ ): Write a function that returns TRUE if the string $s$ is a Palindrome and FALSE otherwise.

- isPalindrome("abcba") == TRUE
- isPalindrome("abcb") == FALSE
- isPalindrome("321123") == TRUE

Break

## Week 7: Strings

1. Making strings
2. Case conversion \& substrings
3. Padding, splitting, \& merging

BREAK
4. Detecting \& replacing

## Detecting \& replacing

| Function | Description |
| :--- | :--- |
| str_sort () | sort a string alphabetically |
| str_order() | get the order of a sorted string |
| str_detect() | match a string in another string |
| str_replace() | replace a string in another string |

## Sort string vectors alphabetically with str_sort ( )

```
x<- c('Y', 'M', 'C', 'A')
X
```

\#> [1] "Y" "M" "C" "A"
str_sort(x)
\#> [1] "A" "C" "M" "Y"
str_sort(x, decreasing = TRUE)
\#> [1] "Y" "M" "C" "A"

## Detect pattern in string: str_detect(string, pattern)

```
tenFruit <- fruit[1:10]
tenFruit
```

| \#> [1] "apple" | "apricot" | "avocado" | "banana" |
| :--- | :--- | :--- | :--- |
| \#> [5] "bell pepper" "bilberry" | "blackberry" | "blackcurrant" |  |
| \#> [9] "blood orange" "blueberry" |  |  |  |

```
str_detect(tenFruit, "berry")
```

\#> [1] FALSE FALSE FALSE FALSE FALSE TRUE TRUE FALSE FALSE TRUE

How many in vector have the string "berry"?

```
sum(str_detect(tenFruit, "berry"))
```

```
#> [1] 3
```

## Count number of times pattern appears in string

```
str_count(string, pattern)
```

x <- c("apple", "banana", "pear")
str_count(x, "a")

```
#> [1] 1 3 1
```

Note the difference with str_detect():

```
str_detect(x, "a")
```

```
#> [1] TRUE TRUE TRUE
```

## Detect if string starts with pattern

Which fruits start with "a"?

```
fiveFruit <- fruit[1:5]
fiveFruit
```

```
#> [1] "apple" "apricot" "avocado" "banana"
#> [5] "bell pepper"
```

## Wrong:

```
str_detect(fiveFruit, "a")
```

Right:

```
str_detect(fiveFruit, "^a")
```

```
#> [1] TRUE TRUE TRUE FALSE FALSE
```

## Detect if string ends with pattern

Which fruits end with an "e"?
fiveFruit

```
#> [1] "apple" "apricot" "avocado" "banana"
#> [5] "bell pepper"
```

Wrong:

```
str_detect(fiveFruit, "e")
```

\#> [1] TRUE FALSE FALSE FALSE TRUE

Right:

```
str_detect(fiveFruit, "e$")
```

\#> [1] TRUE FALSE FALSE FALSE FALSE

## Remember:

## If you start with power ( $\wedge$ ), you'll end up with money (\$).

fiveFruit

```
#> [1] "apple" "apricot" "avocado" "banana"
#> [5] "bell pepper"
```

str_detect(fiveFruit, "^a"') \# Start with power (^)

```
#> [1] TRUE TRUE TRUE FALSE FALSE
```

str_detect(fiveFruit, "e\$") \# End with money (\$)
\#> [1] TRUE FALSE FALSE FALSE FALSE

## Quick practice:

```
fruit[1:5]
```

```
#> [1] "apple" "apricot" "avocado" "banana"
#> [5] "bell pepper"
```

Use stringr functions to answer the following questions about the fruit vector:

1. How many fruit have the string " $r r$ " in it?
2. Which fruit end with string "fruit"?
3. Which fruit contain more than one " 0 " character?

Hint: You'll need to use str_detect() and str_count()

## Replace matched strings with new string

```
str_replace(string, pattern, replacement)
```

x <- c("apple", "pear", "banana")
str_replace(x, "a", "-") \# Only replaces the first match
\#> [1] "-pple" "pe-r" "b-nana"
str_replace_all(x, "a", "-") \# Replaces all matches

```
#> [1] "-pple" "pe-r" "b-n-n-"
```

## Quick practice redux

```
x <- 'this_is_good_practice'
```

Convert xinto: "this is good practice"
We did this earlier:

```
paste(str_split(x, "_")[[1]], collapse = " ")
```

\#> [1] "this is good practice"

But now we can do this!

```
str_replace_all(x, "_", " ")
```

```
#> [1] "this is good practice"
```

## Your turn

1) sortString (s): Write the function sortString(s) that takes a string s and returns back an alphabetically sorted string.

- sortString("cba") == "abc"
- sortString("abedhg") == "abdegh"
- sortString("AbacBc") == "aAbBcc"

2) areAnagrams (s1, s2): Write the function areAnagrams (s1, s2) that takes two strings, s1 and s2, and returns TRUE if the strings are anagrams, and FALSE otherwise. Treat lower and upper case as the same letters.

- areAnagrams("", ""') == TRUE
- areAnagrams("aabbccdd", "bbccddee") == FALSE
- areAnagrams("TomMarvoloRiddle", "IAmLordVoldemort") == TRUE

## Homeworks

- Deadline to submit homeworks 1 - 7: March 10

## Midterm Review

- We'll hold a one-hour review via zoom next week.

[^0]:    \#> [1] "aStringWithSpace"
